Dear General LeTellier:

In accordance with the provisions of our agreement, Intra-governmental order number SADPD-75-1 dated 30 September 1974, we are pleased to submit our final report on the economic projections for the State of North Carolina. This is volume five, the fifth of the six, agreed to in the contract.

This report provides historical and projected economic and demographic data for the eight SMSA's of the State of North Carolina and the individual non-SMSA counties, from 1950 to 2020. These data in "camera copy" have been forwarded under separate cover to Mr. Owen D. Belcher of the Planning Division staff.

During the progress of this project, it has been necessary to consult with, and obtain the cooperation of, members of the South Atlantic Division and its various district offices. I would like to express my appreciation for the excellent professional relationships which have developed between our respective staffs.

If you have any questions regarding this report or the OBERS program in general, please don't hesitate to call us.

Sincerely,

Daniel H. Garnick

DANIEL H. GARNICK, Chief
Regional Economic Analysis Division

Enclosures (Under separate cover)

FOREWORD

The projections in this report incorporate the Census Bureau's 1972 "Series E" national population projection and the Bureau of Economic Analysis' industrial and regional disaggregation thereof, as published in The 1972-E OBERS Projections, November 1974.

The OBERS projections and therefore the county disaggregations may not fully reflect the current energy problem, recent changes in agricultural activity, current changes in conservation and environmental activities and recent shifts in the military population. With no historical base for these matters, their effects can best be measured through the use of economic impact analysis.

These projections are intended as a planning tool, as a contribution to the planning and decision making processes. They are not a goal, nor is it intended that they be used as assigned shares or quotas. Furthermore, they are not intended as a constraint on any areas' economic activity. They contain no expression of desirability or undesirability.

ACKNOWLEDGMENTS

This report was prepared by the staff of the Regional Economic Analysis Division, Bureau of Economic Analysis under the general direction of Daniel H. Garnick, Chief; with Henry L. DeGraff as Assistant Chief. Edward A. Trott, Jr., Assistant to the Chief had responsibility for the report. Directly responsible for the report preparation were Lyle Spatz, Senior Economist and Marian Sacks, Economist.

Additionally, this report could not have been prepared without the contributions and cooperation of Alton "Bud" Skinner of the North Carolina, Department of Administration, State co-chairman of the Southern Economic Review Group - North Carolina (SERG-NC).

The help of various members of the South Atlantic Division, Corps of Engineers and in particular, Owen D. Belcher, Federal co-chairman, SERG-NC and James Eblen of the Tennessee Valley Authority, both of whose guidance were instrumental to the reports completion.

Last, but certainly not least, those planners, demographers, and economists from all levels--Federal, State, local and private, who participated actively in the SERG-NC review meeting and without whose comments the project would have lost its "local" input. For a complete list of meeting attendees, see Appendix A.

INTRODUCTION

This report presents projections of economic activity and population for the counties within the State.

These local area projections are an extension of the OBERS 1/ water resources program which has produced historical and projected measures of economic activity for the Nation and its subareas. The measures produced include personal income, population, per capita income, employment, and earnings, with the last item shown for each of 28 industries. Historical data are presented for 1950, 1959, 1970, 1971, 1972, and projected data for 1980, 1990, 2000, 2010, and 2020.

These projections, as with all efforts to look into the economic future, are based upon an extension of past relationships. The methodology used has four characteristics which distinguish the results from those which would result from a simple linear extension of trends at summary levels.

First, the basic projections were made for 173 economic areas which cover the Nation. These areas were delineated by BEA on the basis of criteria that made them especially suitable for economic analysis and projection.

Second, the economic area projections were made within the framework of projections of the overall U. S. economy. That is projections of population, employment, income, and earnings were made first for the Nation as a whole and then disaggregated geographically.

Third, the projections were based on the assumption that people migrate to areas of economic opportunity and away from declining areas. Accordingly, projections of area income and employment were prepared first, and projections of area population derived from them.

1/ The OBERS program, initiated at the request of the Water Resources Council (WRC) is a joint undertaking of the Bureau of Economic Analysis (BEA) of the Department of Commerce and the Economic Research Service (ERS) of the Department of Agriculture. This program acquired the acronym of OBERS in the mid 1960's at which time BEA was named the Office of Business Economics (OBE) and is a combination of OBE-ERS. The widespread acceptance of the term has led to its continued use as a descriptive title of the projection program even though OBE has been renamed BEA.

Fourth, projections of income and employment were prepared for as many as 37 individual industries in each of the 173 areas. Various methods were used to make the projections, depending upon the individual industry's role in each area's economy. However, the methods used to insure that in each of the 173 areas the projected income and employment constitute an economy with an internally balanced structure. Because the projections were prepared in industrial detail they reflect the effects of variations in growth rates among individual industries which makes it possible for the projected overall economic path of an area to depart substantially from its past trend.

The local area projections in this report were prepared by disaggregating the economic area projections prepared under the OBERS program into the geographic detail necessary to reaggregate them into appropriate groups. The methodology used in breaking out the county projections consisted of the following steps. First, for each projected item and for each past year, the appropriate segment of each economic area was expressed as a percent of that item's value for the entire economic area of which it is a part. This trend in share was then extended on the basis of a fitted least squares regression line. Projected percentages were applied to the parent area totals to obtain absolute values, with the results subjected to judgmental review and adjustment by regional economists. This procedure builds on the large amount of analytical work done for the Nation and its economic areas and yields a set of projections which are consistent with those being used by other agencies in planning. The projections at the economic area's level have been reviewed by many State and Federal agencies. Their suggested changes have been evaluated and taken into account. The local area breakouts reflect these reviews. 2/

2/ A detailed explanation of the concepts and methodology used in preparing the OBERS projections is contained in a report to be published by the WRC entitled, The 1972-E OBERS Projections-Regional Economic Activity in the United States. Volume 1, Concepts and Methodology, November 1974.

NATURE OF THE PROJECTIONS

These projections, as are all other projections, are conditional forecasts of the future. Inasmuch as it is not possible to foresee the future, however, projections must be based on an extension of past relationships believed to have future relevance for the measures being projected. The choice of the past relationships to be extended and the methodology for extending them are based on assumptions, some of which are stated explicitly and some of which are implicit in the projection methodology. The projections represent estimates of economic activity expected to develop during the projection period if all assumed conditions materialize. The assumptions chosen represent those conditions believed to have the greatest probability of realization. Thus the projections represent an attempt, imperfect though it may be, to forecast the economic future with the specification of assumptions and methodology introducing maximum objectivity into the process and giving the user a basis for appraising the validity of the projections. The specification of assumptions and methodology facilitates the construction of alternative projections based on different assumptions and provides a foundation for the evaluation of program-oriented "what if" questions. In particular, alternative projections are useful to reflect assumptions that are likely to materialize if a special program or policy is undertaken to bring them about.

RELIABILITY

Differing orders of reliability characterize the various elements of the projections. These differences are caused by variations in the length of the projection period, the size of the aggregate being projected, the potential for product substitution, and many other factors. A general understanding on the part of the user of the degree of reliability associated with any projection should help avoid misinterpretation and inappropriate use. However, levels of reliability for the projections cannot be stated in statistical terms. They can only be evaluated qualitatively by the user with the results interpreted in light of the uses to which the projections will be put.

Long range projections are less reliable than are those made for short periods: projections of small aggregates are less reliable than those of large magnitude. Thus, projections for 1980 are more reliable than those for 2020 and the reliability associated with the projections for any given industry in a local area group is less than that for the same industry in the Nation as a whole. The reliability of the projections for a minor industry will be much less than that for the more aggregated estimates of total production, total employment or total income.

Another major factor in reliability of the projections arises from differences in the confidence that can be attached to the basic assumptions used. Some assumptions are highly reliable characterizations of the future while others are more conjectural. A projection of the labor force at the national level for 1990, for example, will almost certainly be quite accurate because the labor force for those years will be drawn almost entirely from a population whose number and age distribution are known quite accurately at the present time. The only major uncertainty is the proportion of the population that will desire to enter the labor force and this fraction exhibits substantial stability. However, projection of the labor force or of employment in a given sub-national area is related not only to the current population of that area but also to interregional migration resulting mainly from change in employment opportunities. Such opportunities are among the more difficult elements to project. Therefore, the future labor force of the smaller area, depending as it does on factors which are less certain than those determining the size of the national labor force, is subject to a larger margin of error.

Potential errors in the planning process growing out of errors in the projections cannot be eliminated, but their effects can be minimized through the use of sensitivity analysis and the maintenance of flexibility in plans in order to accommodate deviations from the projections when they occur.

ASSUMPTIONS

The projections are based on longrun or secular trends and ignore the cyclical fluctuations which characterize the shortrun path of the economy. The general assumptions that underlie the projections are as follows:

(1) Growth of population will be conditioned by a fertility rate which represents "replacement level fertility."

(2) Nationally, reasonably full employment, represented by a 4 percent unemployment rate, will prevail at the points for which projections are made; as in the past, unemployment will be disproportionately distributed regionally, but the disproportion will diminish.

(3) No foreign conflicts are assumed to occur at the projection dates.

(4) Continued technological progress and capital accumulation will support a growth in private output per manhour of 2.9 percent annually.

(5) The new products that will appear will be accommodated within the existing industrial classification system, and, therefore, no new industrial classifications are provided.

(6) Growth in output can be achieved without ecological disaster or serious deterioration, although diversion of resources for pollution control will cause changes in the industrial mix of output.

The regional projections are based on the following additional assumptions:

(1) Most factors that have influenced historical shifts in "export" industry location will continue into the future with varying degrees of intensity.

(2) Trends toward economic area self-sufficiency in local-service industries will continue.

(3) Workers will migrate to areas of economic opportunities and away from slow-growth or declining areas.

(4) Regional earnings per worker and income per capita will continue to converge toward the national average.

(5) Regional employment/population ratios will tend to move toward the national ratio.

Regional assumptions (4) and (5) are corollaries of assumption (3). They are in the nature of central tendencies only. In some circumstances they may be counterbalanced by other forces. The migration of retired persons to attractive retirement areas without regard to economic opportunity there is an example of this counter-effect.

BASELINE PROJECTIONS

The estimates of future economic activity in this report are labeled baseline projections with the term "baseline" denoting an initial statistical framework for use in the planning or evaluation of an action or operation. These baseline projections are a best estimate of what can be expected to materialize if there are no policy or program changes of an unforeseen nature or magnitude in the factors which determined past trends. Of course, certain of the factors have been changing over time and will continue to do so in the future. This continuation of change is embodied in the projections.

The projections are in no sense a goal, an assigned share, or a constraint on a region's economic activity. Moreover, they carry no connotation as to desirability or undesirability. Especially, they should not constrain the planner from considering alternative levels of growth higher or lower than those in the baseline, which can be achieved through program planning.

USE OF THE BASELINE PROJECTIONS

The baseline projections serve at least three uses. First, a primary use is in the estimation of future demands for water and related land resources. This estimation will usually entail the application of coefficients to the projected level of economic activity. In this use, the planner may wish to vary the projection in order to test the sensitivity of plans to different levels of economic activity, and to introduce flexibility in the plan in order to accommodate the uncertainty of future conditions.

Second, analysis of the baseline projections may reveal unsuspected future economic problems in an area. These can then be averted or ameliorated through corrective action.

Third, the baseline projections provide a benchmark framework for evaluation purposes. If a remedial or developmental program is proposed for an area, the projected baseline economic activity in the area can be modified to reflect the anticipated effects of that program. Comparison of the new projections with the baseline projections will provide a quantitative measure of the gross effects of the program in each area affected. Since there may be positive effects in the area of development and negative effects in the same or other areas, the net effect of the program is obtained when all regional gross effects are summed.

Use of baseline projections as a foundation for the impact evaluation process in the process planning rests on a two-fold premise. First, the baseline projections used in the planning process represent a dynamic economy approaching equilibrium conditions. Second, changes in income flows are generated by investments which are triggered by changes in the use of economic resources. Assuming initial approximate equilibrium conditions, these changes must arise from a shift in demand and/or supply functions for goods and services affected by a given project investment or program.

Although projections are an indispensable planning tool, experience with the OBERS set issued in 1972 has revealed certain misinterpretations which detract from effective planning. For example, application of the widespread, but erroneous, notion that the OBERS projections are economic quotas to be met by specified regions or subareas eliminates the consideration of alternative regional development programs which might result in more nearly optimal solutions to resource development and management problems. Also, the idea that the resources of one area can be developed and managed satisfactorily without consideration of the impact of such actions on the economy of other areas may lead to erroneous conclusions concerning the economic justification of the actions under consideration. BEA is developing a system to quantitatively measure the economic impact of public investments and programs on regional economics.

PROJECTION METHODOLOGY FOR COUNTIES

First, population, employment, Gross National Product, personal income and earnings were projected for the Nation. Second, the projected national totals of output, employment, and earnings were disaggregated industrially on the basis of projected trends in industry shares of the national totals, modified as necessary by projected trends in the interrelationships of the three aggregates for each industry.

The third step was to allocate the projected national totals of income and employment to the 173 economic areas into which the Bureau of Economic Analysis has divided the country. This was done by extending past trends in income and employment on an industry by industry basis.

The fourth step was to derive area population totals from projected area employment.

The fifth step was to disaggregate the projected economic area figures so as to obtain the local area projections.

The projection procedure was not a mechanical one. At various points in the process, it was essential that judgment be brought to bear, both in estimating the future rate of change in the industrial composition and location of production, and in checking the consistency of the projections. In particular, where employment and earnings were projected separately, it was necessary to review the implied industrial and regional patterns of earnings per worker in order to insure reasonable relationships between employment and earnings.

The decision to derive regional projections through the disaggregation of national totals instead of through the independent projection of each component in each region was based on the assumption that the larger the economic area, the more adequate and reliable are the available statistical measures and the more reliable are the projections that can be made. This assumption applies to the decision to derive projections of industrial detail at the national level by first projecting national employment, output, and earnings and then disaggregating them into national totals for individual industries. Of course, it should be obvious that the disaggregation approach is also subject to substantial error as is any procedure for forecasting the economic future.

GROSS NATIONAL PRODUCT

The most comprehensive and widely used measure of the national economy is gross national product (GNP). It forms the keystone of the economic projections, which are made within the framework of the national income and product accounts.

The OBERS projections are calculated mainly from the supply side of the economy. (The major exception is the determination of requirements of food and fiber to be supplied by agriculture and forestry which will be discussed later). However, this supply-side approach is for convenience in measuring. Implicit in the projections is the assumption that sufficient demand will be generated by the private and public sectors in the production and distribution processes to maintain a full employment level of economic activity nationally.

VARIABLES IN THE GNP PROJECTIONS

GNP, the market value of goods and services produced by the Nation's economy, is projected as the product of projected manhours worked and output per man-hour.

The variables which enter into a determination of man-hours worked and output per man-hour in the economy include population, the working age population, labor force participation, military strength, hours worked per year per man and GNP per man-hour. Some of the considerations which led to the establishment of the level of each variable are discussed below.

Population. Projected national population forms the initial variable in the total projection process. Projections of national population are prepared by the Bureau of the Census and are based on assumptions regarding three factors:

(1) The amount of net immigration, and its age, sex, and race composition:

(2) Age-specific survival rates for mortality: and

(3) Age-specific birth rates for fertility.

There is little disagreement concerning expectations for the first two factors. Concerning the third, demographic opinions range between the view that the long-term down-trend in fertility, which began in 1957, will continue until a rate below population replacement is reached to the less drastic view that there will merely be a substantial fall from the levels reached in 1962-1965. This represents a shift downward in professional expectations regarding fertility level from those reflected in the 1972 series C report.

Official estimates from the National Center for Health Statistics shows a down trend in total fertility rates beginning in 1957. For 1957 the official total fertility rate (the sum of age specific fertility rates) in the United States was 3.767 per 1,000 women. By 1969 this had declined to 2.465, the latest official estimate. 3/ Unofficial estimates prepared by the Bureau of the Census indicate later total fertility rates of 2.472 in 1970, 2.2777 in 1971 and 2.025 in 1972.

In 1967 the Bureau of the Census had developed four projection series, A, B, C and D which ranged from high to low fertility assumptions. 4/ By December of 1972 the Census Bureau had abandoned projection series A and B and had added series E and F. 5/ The four current population projections assume trends to four different total fertility levels at the year 2005 with no subsequent change. The total fertility rates per 1,000 women assumed to have been attained by the year 2005 are:

Series C	2,800
Series D	2,500
Series E	2,100
Series F	1,800

Series E was selected for this set of projections to provide a parallel set to the 1972 OBERS Series C projections. Series E calls for an approximate 44 percent rise in the population between 1971 and the year 2020. It involves a gradual movement toward a total fertility level of 2,100 by the year 2005. Under this E series, births and deaths approach equality. However, due to the character of the present age structure of the population a near-zero growth is not reached until the middle of the 21st century. At that time total population would be increasing approximately by the amount of net migration from abroad -- about 400,000 per year. The E series plus an added assumption of zero net foreign migration results in series X. Under series X the total population approaches a maximum level as births and deaths approach a stable balance.

Table 1 shows the relationship between the C series published in 1967 and used in the 1972 OBERS Series C projections and the C and E series published by Census in December of 1972. The differences between the C series of 1967 and 1972 are statistically insignificant for water and related land resources planning. Differences between the C series of 1967 and the 1972 E series are insignificant through 1980 with regard to total population. If only the population 21 years old and over is considered, and this is the age group from which most employment is drawn, the difference between the 1967 C series and the 1972 E series does not become significant until about the year 2000, however, in 2020 the two series differ by about 16 percent. (See page 12).

3/ Available in October of 1973

4/ See Current Population Reports, P. 25 No 381 (December 1967)

5/ See Current Population Reports, P. 25 No 493 (December 1972) plus unpublished tabulations.

Working Age Population. The working age population is a sub-set of the total population and consists of those persons 14 years of age and older. Its future levels are therefore determined by factors very similar to those affecting the total, with the exception that they will remain insensitive to fertility change patterns for the next 14 years.

Total Labor Force. The total labor force (including armed forces) depends not only upon the working age population but also upon assumptions concerning the propensity of the working age population to seek employment. This is defined as the "total labor force participation rate."

The Bureau of Labor Statistics (BLS) in early 1973 projected age and sex specific total labor force participation rates to 1990. These projections were designed to be sensitive to the varying fertility rates (by way of the numbers of women with children under 5) of Census population projections series C, D, E and F, for the age group 16 and over. Following the same procedures, and with BLS consultation, age and sex specific total labor force participation rates for Census' population series E were projected by BEA for the age group 14 and over to the year 2020.

Previous considerations in regard to labor force participation rates remain valid. However, they must be considered along with the strong consequences of the drastic decline in birth rates involved in moving from the 1967 series C to the 1972 series E population projections. Whereas the total labor force comprises 57.6 percent of the working age population in 1971, it is projected to rise to a maximum of 60.6 percent in 2005 and thereafter receded to 58.5 in 2020. The higher participation rates are a result chiefly of greater female participation which in turn is associated with the lower fertility rates characteristic of population series E.

Civilian Labor Force. The civilian labor force is a residual after subtraction of the armed forces from the total labor force. In 1971, the armed forces numbered 2,817,000. It is assumed that the national and international situation will permit a military cut back to a level of about 2,300,000 by 1975. This level is maintained throughout the projection period. Whereas 96.8 percent of the total labor force was in civilian status in 1971, the combination of total labor force and armed forces projections calls for a rise in this percentage to 98.4 percent in 2020.

Civilian Employment. Civilian employment depends upon the success of civilian labor force participants in finding employment. In 1971, civilian employees accounted for 94.0 percent of the civilian labor force. The assumption used in this report is that on the average over the long run the employment rate will be maintained at 96 percent. The key premise is that fiscal, monetary, labor and other policies adopted will hold the unemployment rate at 4 percent even though this has proven too difficult a task in recent year.s

TABLE 1.—COMPARISON OF SERIES E AND C POPULATION PROJECTIONS

	Total population		Population age 21+

The anticipated rise in labor force participation rates together with maintenance of a 96 percent employment level leads to a projected total employed labor force (civilian plus military) of 133.9 million in 2020. This represents more than a 60 percent rise from the comparable level of 83.3 million in 1971.

Private Civilian Employment. Private civilian employment equals total civilian employment minus employment in general government and government enterprises and represented 84.1 percent of all civilian employees in 1971. This percentage is projected to decline to 83.8 percent in 1980, to 81.9 percent in 2000 and to 80.7 percent in 2020 as government employment grows at a faster pace than that in the private sector. In the period 1950 to 1971, government employment expanded at an average rate of 3.8 percent while private employment grew at 1.1 percent per year. It is anticipated that government employment expansion will continue to outdistance the private, although the disparity will not be so great as appeared in the earlier post war years when many State and local governmental units were under pressure to "catch up" in the provision of neglected facilities and services. Adding to this was the population bulge which caused a massive increase in public school enrollments thus necessitating rapid expansion in employment in public education.

Hours Worked Per Year Per Man. Hours worked per year per man in the private economy declined in the post war years from 2,127 in 1950 to 1,918 in 1971, a rate of decline of 0.5 percent per year. Hours of work are projected to continue to decline but at the lower rate of 0.35 percent per year. This represents a somewhat more rapid decline in hours of work than was anticipated in the 1972 OBERS Series C report. The change appears to be justified by an increase in the rate of decline since 1968.

Private GNP Per Man Per Hour. Estimates of real (constant dollar) GNP per man per hour in the private economy are implicit in the relationship between measured man-hours and measured real product. In 1948 real product per man-hour in 1958 dollars in the private economy was $2.46: by 1971 it had risen to $5.18. This represents an annual growth rate of 3.3 percent. In the later period 1960-1971 the movement was from $3.68 to $5.18 or at a 3.2 per cent rate.

The projected rate of increase in produce per man-hour is placed below the experienced rate in the 1960-1971 period. In part, this is done in the light of the prospective disappearance of the buoyant effect of labor shifts from farm to non-farm work together with other inter-industrial employment shifts which are not neutral in terms of product per worker. In part also, there is recognition of the apparent softness in productivity growth since 1968 apart from the effects of the 1970 recession.

All things considered, the projected rate of increase in product per man per hours was lowered from the 3.0 percent of the series C report to 2.9 percent in this report. This has the effect of lowering product per man hours from $22.92 to $21.02 or by $1.90 per hour in 2020.

GNP CALCULATION

Projected GNP results from the mathematical combination of the above variables.

Constant Dollar Private Gross Product. 6/ Constant dollar government gross product is the sum of projections of gross product originating in civilian general government, in civilian government enterprises and in the military forces. This separate treatment for government is in accord with conventional national income and product accounting practice which measures government product as the number of government employees times average compensation in the base year. Accordingly, 1958 rates of compensation were applied to projected employment in each of the three government categories to derive projected gross government product in 1958 dollars.

Constant Dollar GNP. Constant dollar GNP is the sum of constant dollar private gross product and constant dollar government gross product. The values of the variables from which GNP was derived and both past and projected GNP are shown in Table 2. (See page 12).

While GNP is the most comprehensive and widely used measure of the national economy, it has not been feasible to construct estimates of gross regional product. Accordingly, it was necessary to project national economic measures which could be constructed regionally in order to follow the principle of first projecting national aggregates then disaggregating them regionally.

6/ The national projections are expressed in 1958 dollars because the constant dollar estimates in the national income and product accounts have not yet been measured in 1967 dollars. The earnings data presented in the regional table are expressed in 1967 constant dollars which is the base year for statistical series designated by the Office of Budget and Management.

PERSONAL INCOME AND EARNINGS

The measures chosen for this purpose were personal income and its earnings of persons component (the sum of wages and salaries, other labor income, and proprietors' income). The choice rested on three considerations. First, personal income has a comparatively constant relationship to gross national product; second, its regional location is clear and can be measured with current data sources; and, third, the methodology for preparing regional estimates of personal income had already been developed.

Projected national personal income was derived from historical relationship between constant dollar personal income and constant dollar GNP. A function was fitted mathematically to past values of the income/GNP ratio and extended to 2020. The projected ratio for each decade was applied to projected GNP to derive projected personal income.

In a similar manner, the ratio of earnings of persons to total personal income was projected and applied to projected personal income in constant dollars to yield projected earnings in constant dollars.

INDUSTRY DETAIL

The projected values of three national aggregate measures were disaggregated industrially. The three measures are gross product (which at the industry level is gross product originating, or GPO), earnings of persons, and employment. The disaggregation was into 37 industry groups for which local area data on earnings are available. The disaggregation was made by extrapolating 1948 through 1972 trends in the industrial composition of gross product, earnings of persons, and employment. That is, each industry's share in total employment was extrapolated and applied to the projected all-industry totals of GNP, earnings, and employment.

The resulting projections of GNP, earnings, and employment for each industry were then reconciled. The reconciliation focused on two major considerations. First, projected industry GPO, earnings, and employment were examined in the light of historical trends in the relationships among earnings per worker, GPO per worker, and earnings as a percent of gross product. Second, those ratio relationships for each industry were reviewed in the light of the corresponding all-industry ratios, to judge how well the projected data adhered to the empirical observation that interindustry differences in earnings per worker and GPO per worker diminish over time.

The national projections of industry employment used the data on "persons engaged in production" that are calculated by BEA as an adjunct to the national income and product accounts. These data are conceptually consistent with the series on gross product origination and earnings.

ECONOMIC AREAS

Once projections had been made at the national level for gross product, earnings, and employment by industry, the national industry totals were allocated to subnational areas. The areas chosen were the 173 economic areas into which BEA has divided the country as part of its program of regional measurement, analysis, and projection. Each area consists of an urban center and surrounding counties which are tied to the center by economic activity. Each area generally combines place of residence and place of work so that there is a minimum of commuting across area boundaries.

Each economic area has two types of industries. "Export" industries produce goods and services that are for the most part exported to other areas, providing most of the earnings with which the area residents purchase the specialized goods and services of other areas. "Residentiary" industries produce most of the services and some of the goods required by local business as intermediate products and by the household sector. Each economic area approaches self-sufficiency with respect to its residentiary industries.

There is general similarity among economic areas in the interindustry relationships among residentiary industries and between total export and total residentiary industries within each area. Moreover, these interindustry relationships within areas exhibit substantial stability over time, although they do change as a result of secular trends and developmental thresholds (points at which local markets for intermediate or consumer products become large enough for local production to supplant all or a portion of imports). These characteristics of similarity and stability make the BEA economic areas superior for projection purposes to geographic areas delineated in accordance with other criteria. For example, the relationships among industries located within a single county appear to be meaningless and random. Such relationships would acquire meaning, of coures, if data were available on the county's imports and exports so that total input requirements of each local industry could be calculated. However, assembly of such data at the county level would be a near impossibility. Use of the BEA economic areas for projections and analyses makes in unnecessary to have such data for residentiary industries though export-import information is still needed for the export industries.

LOCAL AREA ECONOMIC MEASURES

The local area economic measures used in the projections are population, total personal income, earnings by industry of origin and total employment.

Estimates of total personal income, earnings by industry, and the nonearnings component of personal income in each SMSA and non-SMSA county have been prepared by BEA for 1929, 1940, 1950, 1959, 1962 and annually from 1965 forward. These were aggregated to the 173 economic areas. Total employment was tabulated from the decennial Census' of Population through 1970 by Economic Area.

ECONOMIC AREA PROJECTIONS: EXPORT INDUSTRIES

Projections of employment and earnings in export industries were made industry by industry, for each economic area, on the basis of projections of the trends in the area's share of total national employment and earnings in each industry. The trends in the shares were projected into the future by fitting least squares regression lines to the logarithms of the historical values of the share and to the logarithms of time and extending these curves to 2020. The projected shares derived in this manner were modified judgmentally in some cases, mainly where natural resources were expected to be depleted or where the historical data appeared weak or in error. The projected area shares after being forced to total 100 percent, were applied to the appropriate national totals and projected absolute values were calculated.

ECONOMIC AREA PROJECTIONS: RESIDENTIARY INDUSTRIES

Projected area earnings in each residentiary industry were derived from the following relationships: (1) the projected regional location quotient (LQ) for the industry, i.e., the ratio of the industry's share of total area earnings to the industry's share of total national earnings: (2) the projected national ratio of earnings in the industry to total national earnings: and (3) projected earnings in total export industries in the area.

The area LQ's for each residentiary industry - item (1) above -- were projected as follows: Analysis of changes in the area LQ's of individual residentiary industries from 1950 to 1971 showed that economic areas trend toward self-sufficiency in residentiary industries, i.e., LQ's trend toward 1.0. Alanysis also showed that the slope of the trend depends upon the magnitude of the LQ. From this analysis, trend values for change in LQ's were set for several different ranges of LQ value. These trend values were then applied to the normalized LQ of each residentiary industry in 1971 and projected LQ's were determined for 1980, 1990, 2000, 2010 and 2020.

The projected national ratio of earnings in each residentiary industry to total national earnings (relationship 2 above) was calculated from the national industry earnings projections noted as the second step of the overall projections methodology.

Relationship 3 was derived from summing earnings of export industries already projected for each economic area.

Projected earnings for each residentiary industry in each area were derived as follows: First, the projected LQ for each residentiary industry (relationship 1) was multiplied by the projected national ratio of earnings in that residentiary industry to total national earnings (relationship 2). This computation gave the projected share of the residentiary industry in the area's all-industry earnings. These shares were summed for all residentiary industries in the area. Subtracting the sum of residentiary shares from unity gave the export industry share. Division of this share into the projected absolute value of export industry earnings -- already calculated -- yielded projected all-industry earnings for the area. To this total was applied the projected share of each residentiary industry in the area's all-industry earnings (the product of relationships 1 and 2) to obtain the projected absolute value of earnings in each residentiary industry in each area. The sum of the area values for each residentiary industry was forced to equal the previously projected national total for the industry, thereby keeping the projected series within the framework of the national projections.

Certain industries are classed as residentiary in some areas and export in others. For example, in one area, hotels may serve principally the business community and local residents while in another, such as Las Vegas, they may provide recreation for visitors and so form an export industry. Similarly, in one area, printing and publishing may involve only local newspaper publishing and local business printing, whereas, in another area, it may serve a national market through book publishing. Earnings in such industries were projected in accordance with each industry's character in that area. This procedure necessitated a break of the projected national totals for these industries into that portion to be treated as export and that as residentiary.

Nationally, total earnings, the sum of export and residentiary industry earnings, make up about 80 percent of total personal income. To complete the projections, property income, transfer payments, and contributions to social insurance (which are netted out of personal income) were projected by modification of the procedure used for residentiary industries.

POPULATION PROJECTIONS

Since regional variations in the rate of natural increase in population in an area (birth minus deaths) are small, the critical element in a local area population projection is interarea migration. As previously noted, it was assumed in these projections that except for retired persons, the major motivating factor in migration is economic opportunity. Accordingly, area population was for the most part projected as a function of area employment. However, in order to reflect properly changes in population which are not directly related to economic opportunity, the 1970 population in each economic area was grouped into three age categories with each category being projected independently. The three groups are: (1) the labor pool (ages 15-64); (2) the pre-labor pool (ages 0-14); and (3) the post-labor pool (ages 65 and over).

Population in the labor pool was projected as a function of area employment. Although there have been some variations historically among areas in the ratio of the labor pool to employment, in most areas they are small. The projection technique recognizes these differences but assumes that they will tend to disappear. As stated earlier, a 4 percent unemployment rate was assumed nationally, with regional variations recognized.

In projecting the fuctional relationship between the labor pool population and employment, the regional ratio of labor pool to employment in 1970 is moved toward the national ratio. It is assumed, however, that the differential between the regional and national ratios will be reduced rather than eliminated by the end of the projected period. The formula used to project an economic area's labor pool-employment ratio is as follows:

$$\frac{P_j^t}{E_j^t} = \frac{P_o^t}{E_o^t} + \left(\frac{P_j^{1970}}{E_j^{1970}} - \frac{P_o^{1970}}{E_o^{1970}}\right) \cdot \left(1 - .15\left(\frac{t-1980}{10}\right)\right)$$

P = population 15-64
E = employment
Superscript t = time (t = 1980, 1990, 2000, 2010, 2020)
Subscript j = region j
Subscript o = U.S. total
Factor [1] is the regional ratio
Factor [2] is the national ratio
Factor [3] is the initial difference
Factor [4] is the closure factor

By the year 2020, the closure factor is .4. That is, only 40 percent of the initial national-regional difference is assumed to prevail.

The projected employment in an area multiplied by the projected labor pool employment ratio yields projected population in the 15-64 years age group.

The pre-labor pool population was projected as a function of the total labor pool using the same approach used in projecting the labor pool with the same closure rate used for the labor pool.

The post-labor pool population was projected independently of the employment data as this age group has little measurable relationship to levels of economic activity. Population aged 65 and over for each decade was projected in terms of population aged 55 and over at the preceding decade using the formula:

$$\frac{p65+_{t}}{p55+_{t-1}} = \frac{p65+_{t-1}}{p55+_{t-2}}$$

The population 55-64 was broken out of the labor pool population at each point using regional percent shares trended to the national percent share in order to provide the necessary estimates of population aged 55 and over.

This formulation holds the relationship between the 55 and over age group at a given time and the 65 and over age group ten years later, constant. This is equivalent to assuming that the impact of migration for the 65 and over age group remains constant since the impact of mortality on the group aged 55 and over remains fairly constant throughout the projection period.

At each step in the projection procedure, the sum of the regional projections were adjusted to the national totals. Except in the case of the population aged 65 and over, these adjustments were less than .2 percent of the initial estimate. The initial projections of the population aged 65 and over ranged from an overestimate of 3.7 percent in 2000 to an underestimate of 5.3 percent in 2020. All differences were prorated among areas so that the sum of the economic areas equalled the independently derived national totals for each age group.

Historically, area trends in relative income per capita (area per capita income expressed as a percent of national per capita income) have shown a pronounced tendency to converge slowly toward 100. Projected per capita income relatives were computed for each area and were analyzed for trend-stability and convergence. Significant departures from anticipated trends in a few instances caused a re-examination of projected income, employment, and population, with subsequent modification in one or more of these aggregates, until satisfactory relationships were achieved.

COUNTY PROJECTIONS

The final step in deriving the local area's projections was to separate the projections for the appropriate 173 BEA economic areas into county segments. The separation into segments was done by projecting each segment's share of economic area population, personal income, total employment, and earnings by industry on the basis of historical trends in those shares. Projected county shares were applied to the appropriate economic area totals to obtain absolute values for each county segment. This procedure was applied to both export and residentiary industries, as the disaggregation of area totals into county segments invalidated the functional realtionships between export and residentiary industries that hold for economic areas and that can be used at that level to project residentiary industry activity on the basis of export industry activity.

The projections produced by BEA were then presented to the Southern Economic Review Group in each state for review. Comments were forwarded to BEA by the State Co-chairman shortly after the review meeting and were incorporated into the reprojection of the small areas.

Population projections for individual counties within the SMSA's were first obtained by using recent (1970-1973) trends in county population to allocate the growth in the SMSA. These data were then subjected to the same review as mentioned above. Individual county population projections are presented in Appendix "B" by State Planning and Development Districts.

TABLE NOTES

Data may not add to higher level totals due to rounding.

(S) Historical Series too small to project.

(A-E) Some or all component data have been suppressed to avoid disclosure of confidential information.

A - data represent 80-99.9% of true value
B - data represent 60-79.9% of true value
C - data represent 40-59.9% of true value
D - data represent 20-39.9% of true value
E - data represent 0-19.9% of true value

(*) Total and per capita income are expressed on a residence basis (income of residents of the area). Earnings are on a where-earned basis.

Historical employment data are from Decennial Censuses of Population 1950-1970; and are on a "place of residence" basis.

Table 3.–Population, Employment, Personal Income, and Earnings by Industry, Historical and Projected, Selected Years, 1950–2020

	1950**	1962*	1969	1970	1971	1980	1985	1990	2000	2020
Population, midyear	151,236,648	185,708,000	201,298,000	203,857,864	206,188,080	223,532,000	234,517,300	246,039,000	263,830,000	297,146,000

APPENDIX A

Participant list for meeting of SERG-NC, Series "E" OBERS projections and methodology held in Raleigh, North Carolina, on March 3, 1976.

Owen D. Belcher	Corps of Engineers (Atlanta)
Donald A. Brande	North Carolina Employment Security Commission
James H. Eblen	Tennessee Valley Authority
Francine J. Ewing	North Carolina Department of Administration
Nick Gajewski	North Carolina Department of Natural and Economic Resources - Economic Development
David A. Garrison	North Carolina Employment Security Commission
Billy R. Hall	North Carolina Department of Natural and Economic Resources
Ellen Hall	U.S. Department of Agriculture - Forest Service
W. F. Irish	North Carolina Utilities Commission
Larry McGee	North Carolina Department of Natural and Economic Resources - Economic Development
Daniel D. Mahoney	North Carolina Department of Natural and Economic Resources - Economic Development
Larry Saunders	Corps of Engineers (Wilmington)
Don Sherry	North Carolina Department of Natural and Economic Resources
Bud Skinner	North Carolina Department of Administration
Edward A. Trott, Jr.	U.S. Department of Commerce - Bureau of Economic Analysis
Steven Wardrup	North Carolina Department of Natural and Economic Resources - Water Quality
Robert C. Wheeler	North Carolina Department of Natural and Economic Resources - Economic Development
Berry A. Williams, Jr.	North Carolina Department of Natural and Economic Resources - 201 Environmental Coordinator

APPENDIX B

Alternative Population Projections

With the continued shifts in population and economic activity since the 1970-71 benchmark period of the OBERS-E projections, an alternative set of population projections have been prepared for selected counties and the State of North Carolina. The alternative projections rely on data through 1974 (economic) and 1975 (population) and the Regional Economic Analysis Division's Monitoring System.

The Monitoring System enables the user to view, in an objective manner, departures from the "normal" trend lines of the OBERS-E projections; adjustments may then be made to accomodate these variations if warranted.

Application of the Monitoring System to the North Carolina OBERS-E projections pointed out differences between the monitor base and the current level of population; thus, a series of alternative population projections were prepared for the State. The majority of these differences appear to be both geographically and industrially related to the OBERS-E military projections. 1/ Thus, the most significant changes in the projections occur in the near term and are demographic in nature.

1/ See pp 25-26; Volume 1, of The 1972 OBERS Projections, Regional Activity in the United States, Series E Population.

The alternative population projections are presented in Table B-1, with comparisons of the monitor base and current economic activity shown in Table B-2 of this section of the report.

Appendix Table B-1.—Population Projections

	"Series E" 1/	Alternative	Change	Percent difference
	(data in thousands)			
1970 2/	5,084			
1972	5,214			
1973	5,302			
1974	5,363			
1975	5,451			
1980	5,736	5,758	22	.4
1985	6,090	6,065	- 25	- .4
1990	6,465	6,389	- 76	- 1.2
2000	6,973	6,873	- 100	- 1.4
2010	7,449	7,302	- 147	- 2.0
2020	7,864	7,660	- 204	- 2.6

1/ As published in OBERS, 1972-E, November 1974.

2/ 1970 Census, April 1; all other years, July 1.

At the present time these current economic data are not available below the State level. Therefore, using post-censal population growth rates through 1974, in conjunction with the long-term growth trends from the "Series E" projections, the alternative population projections have been disaggregated into individual counties. These data are presented in Table B-3 of this report starting on page B-5.

Appendix Table B-2.--State of North Carolina - Actual Versus Monitor Base Estimates. 1972-1975, Two Quarters

	Actual estimate				Absolute difference			
	1972	1973	1974	1975 two quarters	1972	1973	1974	1975 two quarters
